

## Allowed time: 40 minutes -> camera matriciale (Ha una risoluzione righe per colonne)

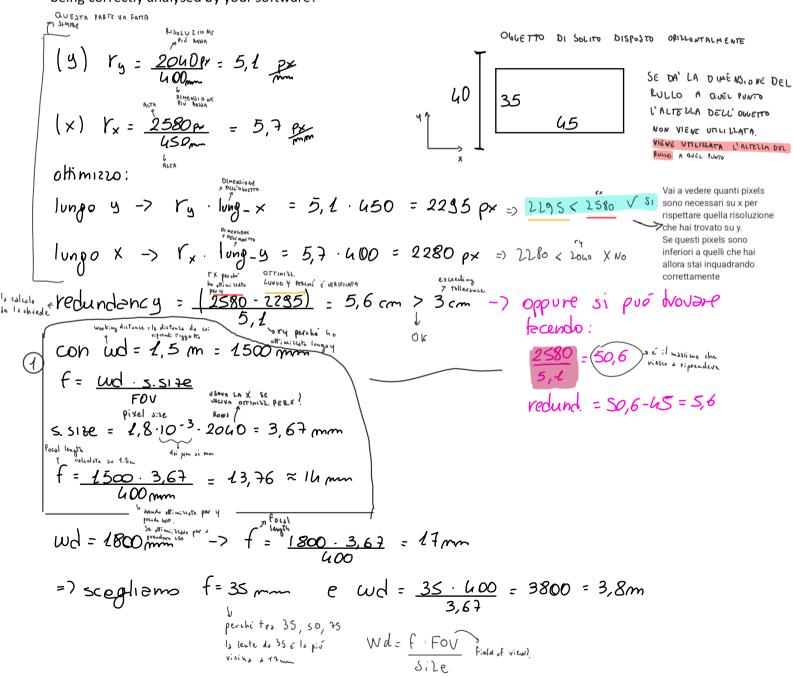

Consider a camera of 2040 rows x 2580 columns whose pixel size is 1.8 um. Image of acquiring a scene for analysing objects of 45 cm \* 35 cm coming over a belt large 40 cm.

Define the ideal focal length for surely acquiring an entire object, with at least 3 cm of exceeding tolerance in the direction of the motion, when the camera is elevated at 1.5 m from the belt.

Suppose You have available lens with focal length 35 mm, 50 mm and 75 mm: **choose the best one** for working at the distance which best fits 1.8 m, **compute the correct height for positioning the camera**, and **compute the achievable resolution**.

With this set up, which is the highest speed of the belt for being sure that we may acquire an entire object, when the camera works at 100 fps?

Which is the size of the smallest detectable defect, if the defect resolution requires at least 10 pixel for being correctly analysed by your software?

Frame rate = 
$$100fps$$
 =  $T = \frac{1}{100} = 0.01s$   
 $V = \frac{2580}{5.1} = 50 \text{ m}$ 

LA CAMERA LIVERRE É DISPOSTA VERTICALMENTE IN MODO DA FIRENDERE THE L'OUVETTO

il lato più lungo va messo in orivoutale

MPO 2.

266; 2mo due devices (2 CAMERE)

FOR ALL (30 minutes): CAMERA LINEARE ( ha la stessa visoluzione sia per le righe che per le colonne)

Consider the following line scan cameras: Device "1": sensor of 4096 points, each point of 2.6 micron \* 2.6 micron, able to acquire up to 20.000 lines per second, price 800 euro. Device "2": sensor of 2048 points. each point of 4.2 micron \* 4.2 micron, able to acquire up to 30.000 lines per second, price 450 euro.

Define two setups for analysing objects having a surface of 3 m \* 15 m at a resolution of at least 1 pixel / 500 micron (both along X and along Y): setup 1 based on Devices like the "1", setup 2, based on Devices like 1px/600 micron => Tpx => 2px/man d: viseluzione

Which is the preferable setup, in case we wish save money?

Which is the preferable setup in case we wish the fastest acquisition period? V1 e 12

Consider now only the setup 2:

- **How many objects** can be analysed in 1 hour?
- And at which distance from the object the camera should be located mounting a lens having focal 1.2 length of 50 mm?
- Which is the smallest size of a detectable defect, if your software needs at least 10 pixel \* 10 pixel for a correct processing? Sarebbe state inpate

Servono 3 dovice

Costo 1 = 2.800 = 1600 €

CONSIDERALE IL FATTO CHE CON IL DEVICE 7 DEFLONO 3 LENTI È CON IL DEVICE of NE SERVONO 2 !!!

$$\sqrt{1}$$
  $V_4 = \frac{lps}{r} = \frac{20.000}{2,73} = 7,3 \text{ mg}$ 

$$2 \left( 5e \ f = 50 mm = \right) \ \text{Wd} = \frac{50.3000}{84} = 17,4 m$$

1.3 
$$\frac{10 \text{ px}}{\text{Vy}} = \frac{10}{2,000} = 4,9 \text{ mm}$$

## TIPO 3

Consider the following line scan camera:

Device "1": sensor of 2048 points, each point of 4.2 micron \* 4.2 micron, able to acquire up to 30.000 lines per second, price 450 euro.

and the matricial device:

Device "2": sensor of 2048\*2560 points of 2.6 micron \* 2.6 micron

- A) Define two setups for analysing objects having a surface of 2.0 m \* 2.4 m at a resolution of at least 1 pixel / mm (both along X and along Y) in terms of any additional device needed for the acquisition set up.
- B) Define the ideal focal length for both the set up, in case we have to adopt a working distance in the range 2 m 3 m

Suppose now, that both the devices mounted simultaneously over the same scene.

- C) Which is the fastest speed that can act over the object for being correctly acquired by both the set ups?
- D) Which is the shortest shutter time of the matricial camera, in case we do not want motion effect greater than 1 pixel?

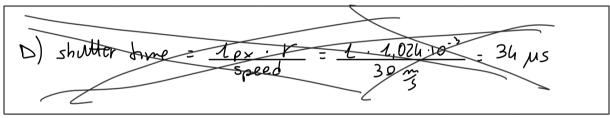

offmirro;

B) 
$$wd = 2000m$$
  $f = \frac{2000 \cdot 8.6}{2000}$  min  $= \frac{6000}{2000}$  length

$$f = \frac{2000 \cdot 5.3}{2000}
 f = \frac{3000 \cdot 5.3}{2000}
 hin & fold & his
 length$$

c) 
$$V_1 = \frac{30000}{1,074} = 30 \text{ m}$$

per quella matriciale non ci sono vincoli di velocuto, l'importante è che ci sia una veloute adequate a non avere un'immagine stocata

LAV SI CALCOLA CON ULIFPS PER LA MATRICIALE E ULI LPS PER LA LINEARE PER LA TEDRIA
